1. Identify products with stock levels below reorder point.

Supplier	Warehouse	Sum of Average Inventory	Sum of Inventory Level	Stock Status
Supplier A	Warehouse 1	28,279.50	7819	Low
Supplier B	Warehouse 1	31,422.00	9203	Low
Supplier C	Warehouse 1	42,153.00	14320	Low
Supplier D	Warehouse 1	17,809.50	6065	Low
Supplier A	Warehouse 2	27,122.50	8449	Low
Supplier B	Warehouse 2	19,980.00	7168	Low
Supplier C	Warehouse 2	29,711.50	7767	Low
Supplier D	Warehouse 2	18,243.50	4817	Low
Supplier A	Warehouse 3	42,755.00	11431	Low
Total		3,74,209.50	115005	

2.Perform univariate analysis on stock levels.

3.Which warehouses experience frequent stock shortages?

Warehouses that show a higher count of items flagged as **Low Stock** experience frequent stock shortages. These warehouses have inventory levels consistently below the calculated reorder threshold, indicating recurring supply gaps and a higher risk of stock-outs.

4.Create a DAX measure to classify stock status (Low, Optimal, Excess)

A DAX calculated column or measure is created to classify stock status into **Low, Optimal, and Excess** by comparing current inventory with threshold values. This classification helps quickly identify understocked and overstocked items for better inventory control

5.Calculate inventory turnover rate.

Inventory Turnover Ratio =
DIVIDE(SUM('Inventory and Supply Chain Dataset'[Cost of Goods Sold]),SUM('Inventory and Supply Chain Dataset'[Average Inventory]))

6.Identify slow-moving products using sales and inventory data.

Slow Moving =
IF(
 'Inventory and Supply Chain Dataset'[Units Sold] < 50 &&
 'Inventory and Supply Chain Dataset'[Inventory Level] > 200,
 "Slow",
 "Fast"
)

7.Design a dashboard to monitor stock health.

8.Which products require immediate replenishment?

Products that have **inventory levels below the calculated reorder threshold** are identified as requiring immediate replenishment. These items show critically low stock and pose a risk of stock-outs if not reordered promptly.

9.How can inventory insights reduce holding costs?

Inventory insights reduce holding costs by identifying **excess stock, slow-moving items, and overstocked warehouses**, enabling the company to adjust reorder quantities and avoid unnecessary storage. By maintaining optimal inventory levels instead of overstocking, businesses minimize warehousing, insurance, and obsolescence costs while improving cash flow efficiency.
